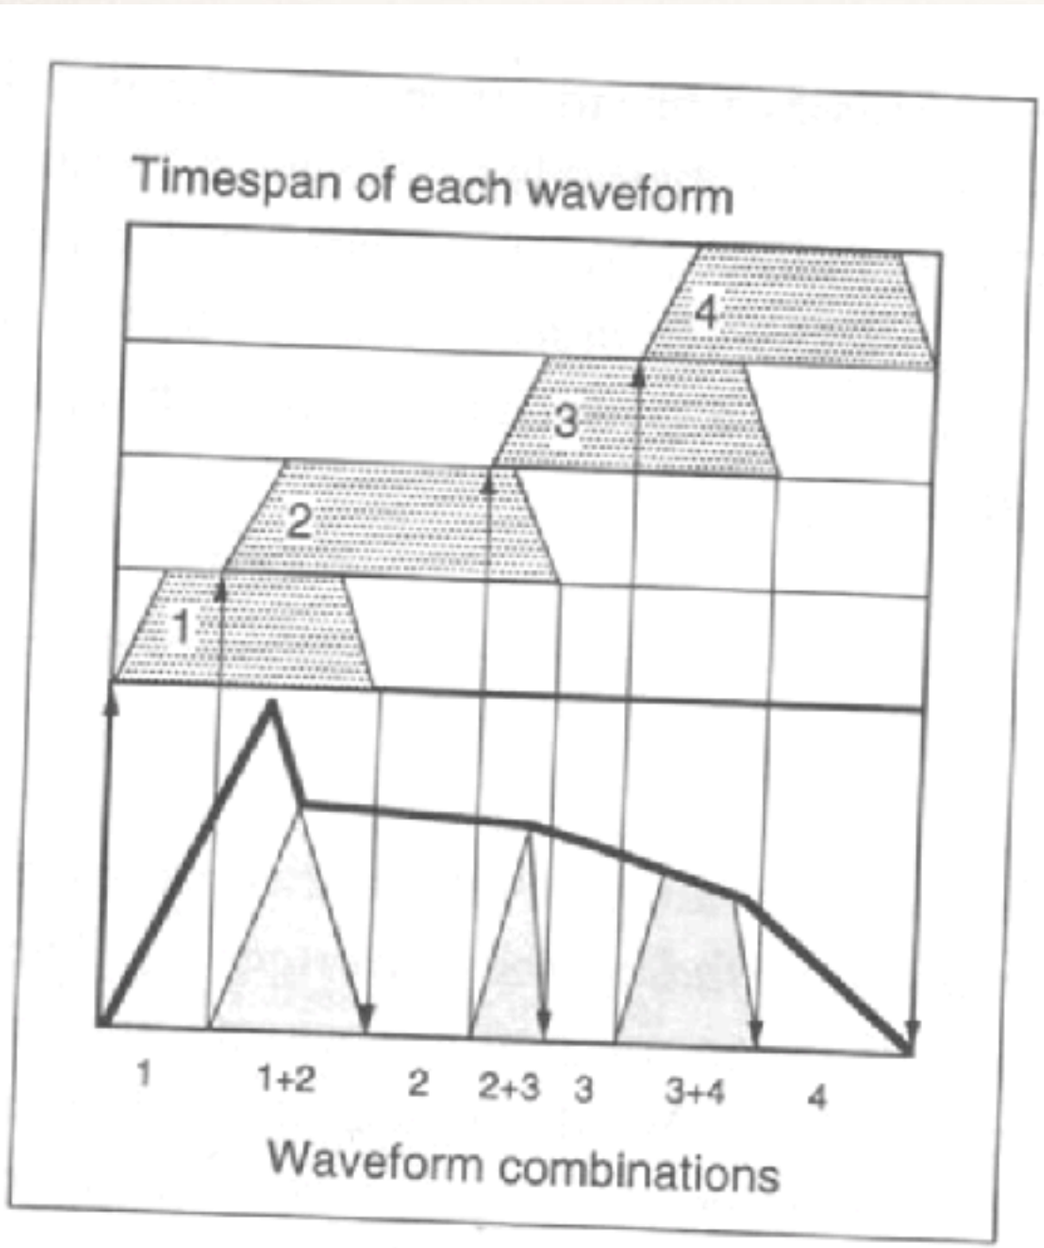
Wavetable Crossfading

Prophet VS (1985)

Crossfading



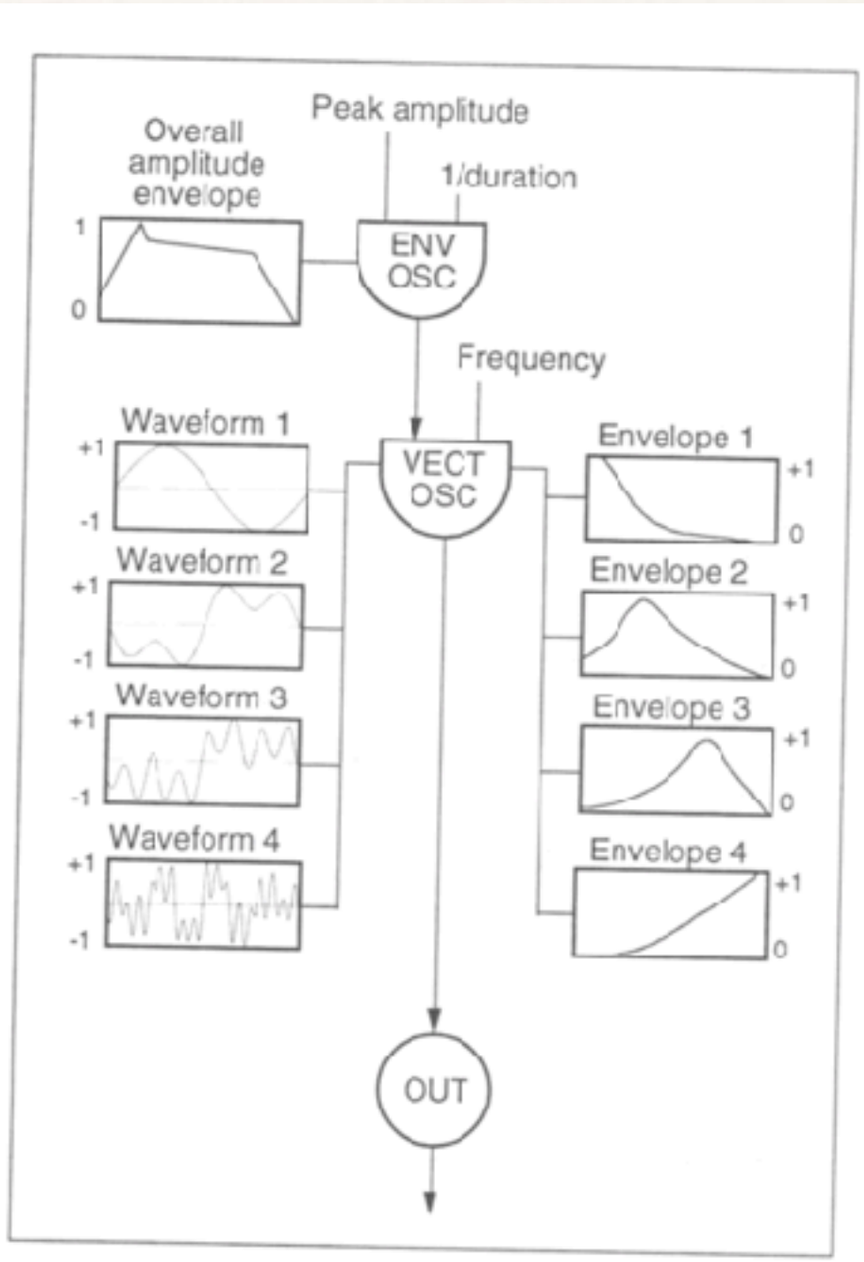


Figure 5.2 Wavetable crossfading (vector synthesis) instrument using four wavetables. Each envelope on the right applies to a wavetable on the left.

Wavestacking

Wavestacking

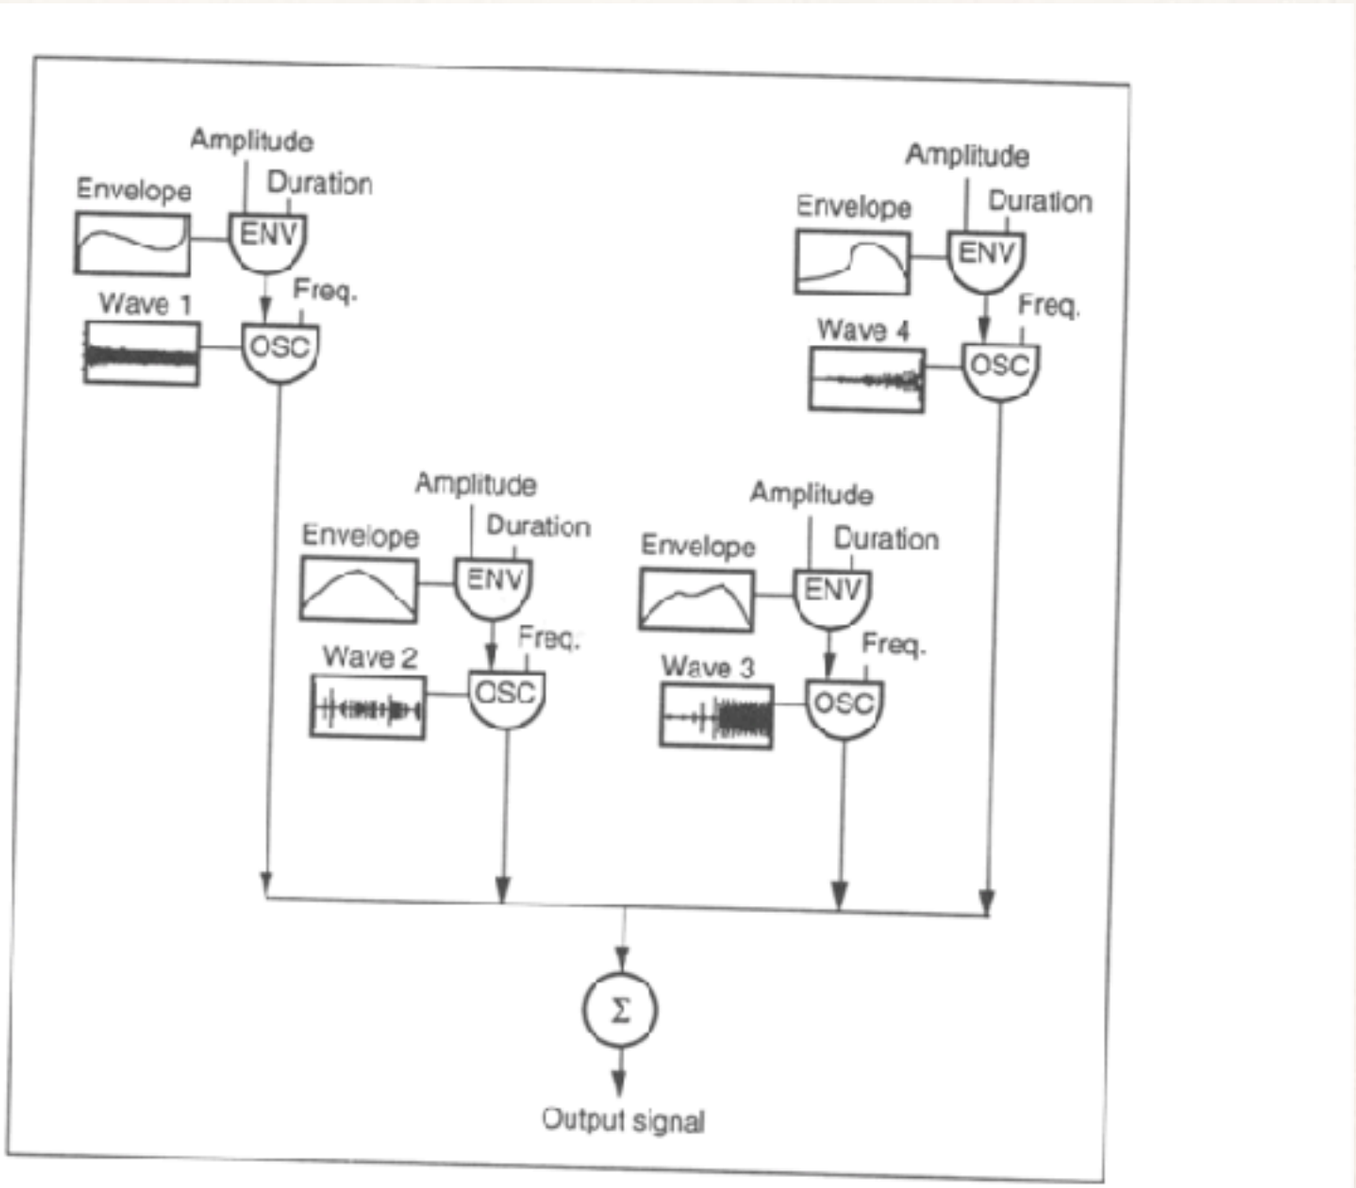

Figure 5.5 Wavetable stacking. The signals from four oscillators added together. Notice that the wavetables contain not simple periodic functions but long sampled sounds.

SYTER

A prime example pf a system for time-varying subtractive synthesis is the SYTER - a digital signal processor developed in the late 1970

Mechanismus

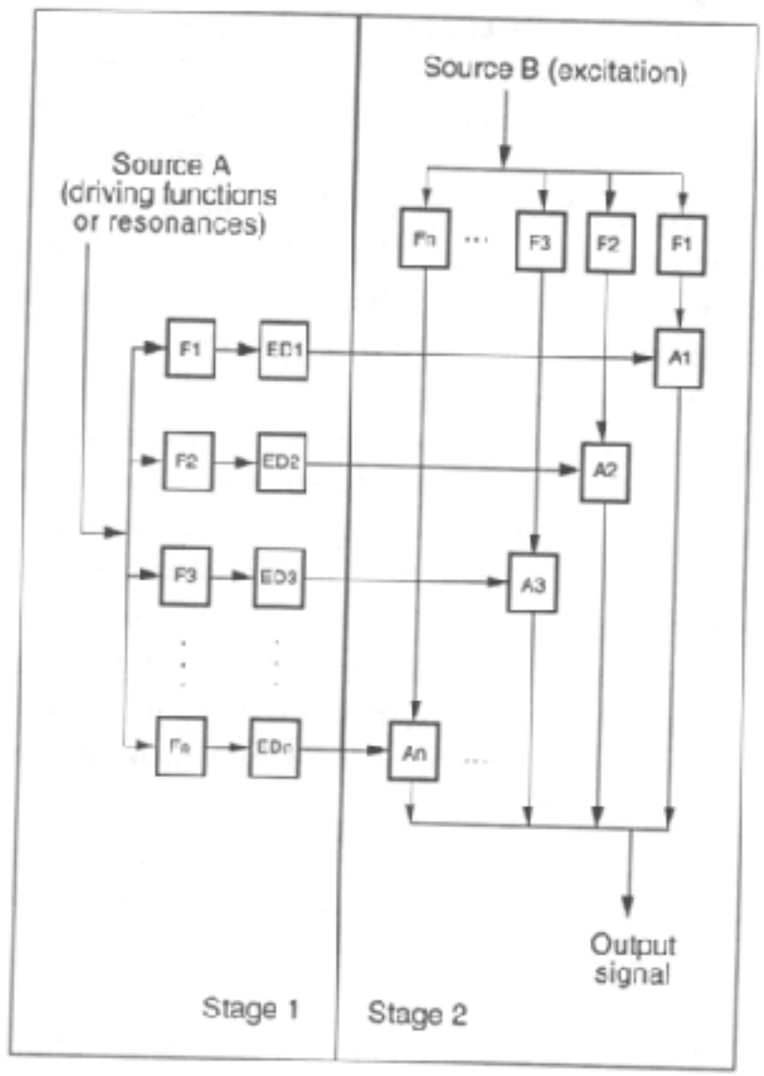

Figure 5.33 Vocoder. Stage 1 is the analysis part, and stage 2 is the synthesis. "F" stands for filter, "ED" stands for envelope detector, and "A" stands for voltage-controlled amplifier—an amplifier whose gain is determined by a control voltage fed into it from the envelope detector. The same structure can also be realized in digital form.
